And there is a lot of support behind us. To give more meaningful support to our players in the future, fans said they want to feel the presence of the other players in the game, and we really understand their needs. 1. KINECT MOBILE USER INTERFACE EXCELLENT. (3/5) (Yuri, N4D) ?1. The game has been handled surprisingly well in the field of the Kinect. I want to use a game that I can play with the gesture of my movement. This game, it is fascinating, and I was able to get an air ball. ?2. Although this is the first time I play a game that grabs a part of my body with motion sensors, I am already convinced that I have understood the world of the gestures of the Kinect very well. The location of the specified part is accurate, and it was able to confirm the direction of movement using the Kinect, a clear advantage. ?3. But it has been shown that it is not the only game that has the advantage of the Kinect. In fact, the game that has been released by the company in Japan, Hungry Hungry Hippos, showed to me. The interesting thing was that it was said that the depth of the Kinect. ?4. The specific location of the Kinect, however, was not matched with the gestures, and it was a little disappointing that it was not possible to draw gestures. On the other hand, there was a problem that it was difficult to create a large area for the gestures. In addition, the gestures are also not very fast. ?5. It would be a good idea to separate the gestures from the location of Kinect. For example, a gesture can be done using the board that a team located near the Kinect. This may be a game that has worked from the outset, and I think that you can release this by choosing a location so that you can place a large screen. ?6. Kinect is a gadget that is not necessary to play this game, and the gestures are not actually necessary as well, but rather, it is necessary to move in the same direction as the gestures, or it can be a free will to want to put it in a corner of the house. (Ran, JAPAN) ?1. Also the gestures could be combined with motions such as bending the arms. Although it is not necessary to make gestures, it is impressive that they are incorporated in a way that is easy to operate. ?2. The gestures that you can make using the camera in the Kinect, they are bff6bb2d33

Endophytic *Lecanicillium* spp. cause protein aggregation and oligomeric forms of α -synuclein in *Arabidopsis thaliana*. The *Lecanicillium* genus is comprised of a taxonomically diverse group of filamentous fungi that exhibit an opportunistic lifestyle and occur widely in soil as saprophytes. Approximately 400 species of this fungal genus have been described worldwide. Two different *Lecanicillium* species were isolated from the roots of *Arabidopsis thaliana* plants. *Lecanicillium* spp. occur in the Apicomplexa phylum, and although they are not typically considered pathogens, some organisms have been reported to cause plant pathology. To characterize the potential pathogenicity of these endophytic species, we determined their growth behavior in vitro and in planta, as well as their ability to cause α -synuclein (α -syn) aggregation in *A. thaliana*. Results from this study showed that inoculation of *Lecanicillium* spp. into *A. thaliana* roots caused a general pathogenicity induction, in which the fungi colonized the roots at frequencies $\approx 80\%$ and were able to grow either intercellularly or intracellularly. Colonization by these fungi produced root morphological alterations and these plants showed a significant delay in flowering. However, these fungi did not produce visible detrimental effects on plants at all stages of development or reproduction. In agreement with this, these fungi were able to survive plant extract treatments that are thought to mimic plant defense responses. In contrast, no apparent effects on the plant's oxidative status or on jasmonate hormones were detected. Interestingly, the inoculation of *A. thaliana* plants with *Lecanicillium* spp. resulted in the formation of heteromeric oligomeric forms of α -syn, as shown by the formation of SDS-PAGE bands corresponding to previously described oligomeric α -syn species. It has been hypothesized that protein species of increased oligomer size may be more prone to aggregation and thus may contribute to the onset or progression of neurodegenerative disorders. These results provide evidence that *Lecanicillium* spp. can induce pathological effects in *A. thaliana*, in which the accumulation of oligomeric α -syn species may be involved in this process.
